

# Closure operators on additively idempotent semirings

*Damian Siejwa*

Warsaw University of Technology

## **Abstract**

The talk will focus on various closure operators defined on semigroups and additively idempotent semirings. In particular, we will be interested in construction of spectral spaces. During the talk, I will present several examples of closure operators and spectral spaces, and I will discuss how closure operators can be used to prove the algebraicity of certain lattices.
